Description

Hi, just to recap what I reported on IRC the other day.

All services (MPEG4-HD) on a DVB-S trasponder (1W, 10934V) fail detection in tvheadend. Whereas a tool such as w_scan finds them just fine. The only remarkable thing about the services are the fact that they are on a DVB-S transponder where no other (non-HD) services are present. As far as I can tell this is the only such case with my provider. All other MPEG4-HD services are either on DVB-S2 transponders or share a DVB-S transponder with non-HD services. I have no problem detecting those services in tvheadend.

I have made a mux dump available here:

http://feathers.os-tr.net/~mortenkn/mux-dump-1W-10934-V.ts

Regards, abyssmal.

Update on this one, after removing my .hts directory and setting everything up from scratch every missing channel got detected. So I no longer have this problem. It might still be some sort of bug, but I guess it might be difficult to find?

- Found in version set to worksforme

Yes, i tried looking at the .ts file but I could not find any full descriptors of services in it.
I find it strange that Tvheadend manage to pick anything up at all from this mux.

Either way, i'm closing this.
