Description			
Hi,			
Jaroslav Kysela wrote (in #4553):			
The server should advertise itself when booted (for UPnP config). Yes, the period might be configurable. Create another feature request.			
I request then this!			
The idea is quite simple: In the SAT>IP server configuration, a new advanced parameter describes an user configurable interval. This is a list of intervals in seconds, in the form of "2,15,60,900". This list reads as: after 2 seconds of the start of running TVH then schedule the announcement; and after 15 seconds of end of the announcement launch another announcement; after end this second announcement then wait for 60 seconds and reannounce; and the same until the last, and then every 900 seconds do the announcement.			
<u>The key point is starting to wait when the previous announcement is completed (to avoid troubles with small intervals).</u>			
You agree to implement this?
