Description Hello. I am running into a issue where TVH doesn't always stream the highest available quality as it seems to count 720 and 1080i as equals. I thought it would be nice if there was an option to play best available. Cheers, Chris

Guessing this is IPTV and also guessing HLS/DASH?

Add more information.

Sorry I should have been more clear.

I have a DVB-T and an DVB-C network merged together. TVH considers 1080i and 720 as equals (SDTV). Currently I am manually overriding the "type" on these 1080i channels to "HDTV".

I thought a "best available" option could literally pick the highest quality stream available.

Thanks,
Chris
