Description			
<p>Hi, i've been wondering, i'm running TVheadend on my RPi 3 for 3 years already(and it is still going strong!) and i finally started to have a look on other satellites except still watching the CZ/SK Skylink on Astra 3 23.5° E. Until now i didn't even use diseqc for anything but since yesterday i set up USALS to rotate my dish like it did years years ago on old STBs. Firstly i had problems with it rotating more than it was even needed and other stuff but i managed to fix all of that. Now since it is working just fine i miss one thing i had on other STBs, and that's the icon or notification showing that dish is rotating. I think it could be implemented on Kodi using notification like when no signal or no free adapters are available. It could even show to which "network" it is rotating. Is it possible to have it implemented somehow?</p>
